

ESET + big .mkv file=trouble?

Posted by liger - 06 Sep 2009 12:35

Lately my eset has been acting up with on the fly scan of 2gb .mkv file that is beaing downloaded thru torrent

tinyurl.com/ld8bku onclick="window.open(this.href);return false;

It starts with HEAVY disk activity, then sudden use of ram up to 96% (have 2 GB here) at which point u cant do anything but wait.

And wait

and then this is what i get

Real-time file system protection file Warehouse.13.S01E04.720p.HDTV.x264-SiTV.mkv.!ut

a variant of Win32/PSW.Agent.NNI trojan cleaned by deleting

Event occurred on a file modified by the application: C:Program Files (x86)uTorrentuTorrent.exe

Is that even possible? This isnt some file renamed to .mkv, this is a real video file. Can something else be imbedded in video extension .mkv that executes on running video (thru MPC)?

=====
